Thus, the origin of this clone is uncertain. This caution should kept in mind should you use this clone.

Competition experiments using the DNAseI protection assay showed that an oligonucleotide cont; 15 tandem ATT repeats was an effective competitor for binding of the HeLa factor. This oligo was used to prepare an oligonucleotide affinity column for purification of RIP60 from Chinese hamster cells. The protein recognises and binds to an (ATT)n motif in the dhir gene ori. It can also bind to the yeast ARSI domain B. See Q22753 and Q24811.

New biocompatible medical devices and articles - using a lactic acid-glycolic acid polyester in which monomer units are individually and specifically determined

Example 2; Page 53; 67pp; English.

The sequences given in Q71814-16 represent fragments of the synthetic polyester genes given in Q71801-02. These fragments were used in the production of the full length polyester gene in the plas pMAL-p2. This plasmid was used so that the polyester could be expression an E. coli cell free medium, as pMAL-p2 is recognised by E. coli
                                                                                                                                                                                                                                                                                            01-JUL-1994.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   cc template for the polypeptide leader. The resulting plasmid pMAL-2c contains the complete polypeptide leader. The resulting plasmid pMAL-2c contains the complete polypeter coding sequence ligated in frame with ct the leader sequence. The expressed sequences represent synthetic genes which were used in the synthesis of polyseters derived from the cc armino acid analogues of an amino acid except pro. Of the three stop codons, UAA, UAG and UGA, one of these stop codons is reversed for the cc stop signal for the polyester. The remaining two stop codons are available for encoding the monomer units of the polyester. Lactate and glycolate are encoded by UAA and UAG, respectively. Initiation of ct translation always starts at an AUG codon, therefore the first lactate cc of the chain may be encoded by an AUG codon. This is accomplished ct through the use of a specially modified Met-tRNAH modified to carry lactate instead of Met. Alternatively a Met is incorporated in the first position of the polymer chain. The resulting polymer is treated could be used to produce sutures, staples, clips, drug delivery and course the manner may be used to produce sutures, staples, clips, drug delivery
DR New biocompatible medical devices and articles - using a lactic relation by 4-273324/34.

Provided the medical devices and articles - using a lactic provided to the provided the medical polyester in which monomer units are individually and specifically determined the provided transcription contains the 5 fragment of the synthetic genes which encode polyesters, contains the 5 fragment of the synthetic genes which encode polyesters, contains the 5 fragment of the synthetic transcription initiator and followed by Poki and Hinddill restriction sites. A further fragment of the synthetic genes were ligated into psport ic to give plasmid psport id (see also Q71810-11), with the final fragment being conserved in a third round of ligation to give psport ie (see also Q71812-13). The E. coli trph initiator sequence was used to express the full length sequences represent synthetic genes which were used in the expressed sequences represent synthetic genes which were used in the correct synthesis of polyesters derived from the a-amino acid analogues of an entire transcription to give a provided to the correct provided
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

Of the three stop codons, UAA, UAG and UGA, one of these stop codons is reversed for the stop signal for the polyester. The remaining two stop codons are available for encoding the monomer units of the polyester. Lactate and glycolate are encoded by UAA and UAG, respectively. Initiation of translation always starts at an AUG codon, therefore the first lactate of the chain may be encoded by an AUG codon. This is accomplished through the use of a specially modified Met. tRNAf modified to carry lactate instead of Met. Alternatively, a Met is incorporated in the first position of the polymer chain. The resulting polymer is treated with cyanogen bromide to remove the Met. Co-polymers produced in this manner may be used to produce sutures, staples, clips, drug delivery devices, pins and screws.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Claim 6; Page 6; 31pp; English.

Primer PDJ33 is one of several primers which are preferred for use in amplifying inter-Alu regions of DNA. The amplified fragments are then subjected to 2-D electrophoresis on the basis of length and differences in base sequence. The resulting separation pattern is transferred to a filter for screening with a probe. The method can be used to detect genetic variation.

Example 1; Page 45; 117pp; English.

This is the nucleotide sequence for the PCR primer used in the amplification of the Alu repeat sequence, which is used to demonstrate the processes described in the invention. It involves the creation and use of circular yeast artificial chromosome (YAC) to selectively clone specific nucleic acids from a background of mixed nucleic acids by introducing the vector(s) into E. coli cells. They can be used to rapidly isolate human DNA where only a part of the sequence of DNA is known. Using the methods large fragments of DNA can be easily cloned and analysed.

PT New Oligomers contg. modified bases - which form a triplex with pr G-C doublet in a DNA duplex, for treating and diagnosing HIV, pr G-C doublet in a DNA duplex, for treating and diagnosing HIV, pr G-C doublet in a DNA duplex, for treating and diagnosing HIV, pr G-C doublet in a DNA duplex, for treating and diagnosing HIV, pr G-C doublet in a DNA duplex, for treating and diagnosing HIV, pr G-C doublet in a G-C duple in the first soligomer is the forman garriang a triplex at protein grower of the duplex. The specific trarget sequence of this oligomer is the human leukocyte adhesion protein p150, 95 and the solumit gene (HUMINFU2) beginning at nucleotide 2370 contg. a grapha subunit gene (HUMINFU2) beginning at nucleotide 2370 contg. a grapha subunit gene (HUMINFU2) beginning at nucleotide 2370 contg. a comparison of the duplex. The oligomer, of the duplex trargets, e.g. HPV, HER; HIV chapter rich sequence concd. on one strand of the duplex. The oligomer, of the chapter is the duplex triple conditions of the sasquers and inflammation. The triple conditions thus assays may be carried out without subjecting the test specimen to harsh conditions. The chapter is conditions of the condition
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

CC A single-stranded DNA (or its complementary strand or the corresp.

CC A single-stranded DNA) which comprises one of the 7837 "GS" sequences

CC double-stranded DNA) which comprises one of the 7837 "GS" sequences

CC given in T19001-T26837 and which is able to hybridise to part of

CC human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature)

CC sequences were obtained from 3'-directed CDNA libraries prepared

CC income various human tissues; synthesis of cDNA was initiated from the

CC untranslated sequence is unique to a particular mRNA species, almost

CC untranslated sequence is unique to a particular mRNA species, almost

CC all the 3'-oriented cDNA hybridise with specific mRNAs. Each library

CC is constructed so as to reflect accurately the relative abundance of

CC different mRNAs in the particular tissue from which it was derived.

CC The appearance frequency of a given GS in a cDNA library can be

CC determined (esp. using primers and probes derived from the GS

Sequences) as a means of diagnosing abnormal cell function or for

CC recognising different cell types.

Example 1; Page 45; 117pp; English.

This is the nuclectide sequence for the PCR primer used in the
amplification of the Alu repeat sequence, which is used to
demonstrate the processes described in the invention. It involves
the creation and use of circular yeast artificial chromosome (YAC)
to selectively clone specific nucleic acids from a background of
mixed nucleic acids by introducing the vector(s) into E. coli cells.

They can be used to rapidly isolate human DNA where only a part of the
sequence of DNA is known. Using the methods large fragments of DNA can
be easily cloned and analysed.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         용
              Pr Assay for testing the carcinogenic properties of a test substance by introduction of a reporter gene expression vector containing a propertitive DNA sequence that is unstable in cancer cells repetitive DNA sequence that is unstable in cancer cells bisclosure; Page 15; 103pp; English.

CC The present sequence represents an oligonucleotide used in the course of the construction of assay plasmids, which are used in the course of the construction of assay plasmids, which are used in the course of the construction. The specification describes an assay for testing the construction of assay plasmids, which are expression vector comprises introducing into cells a reporter gene expression vector comprising a crepetitive DNA sequence which exhibits instability in cancer cells, conference of the reporter gene, exposing the resulting cells to the test substance and determining whether the test substance is carcinogenic or anti-carcinogenic by comparing the frequency of reporter gene expression in cells which have not been exposed to the test substance. The assay can be used to identify human dietary components that protect against DNA contents of the construction of the construction of the construction cells with the frequency of reporter gene expression in the used to identify human dietary components that protect against DNA constructions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

The amplified fragments then subjected to 2-D electrophoresis on the basis of length and differences in base sequence. The resulting separation pattern i transferred to a filter for screening with a probe. The method consent to detect genetic variation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            15-OCT-1998.

PT Assay for testing the carcinogenic properties.

PT by introduction of a reporter gene expression vector containing a propertitive DNA sequence that is unstable in cancer cells Disclosure; Page 16; 103pp; English.

CC The present sequence represents an oligonuclectide used in the course of the construction of assay plasmids, which are used in the course of the construction. The specification describes an assay for testing the carcinogenic properties of a test substance. The assay comprises controducing into cells a reporter gene expression vector comprising a repetitive DNA sequence which exhibits instability in cancer cells, whereby instability of the repetitive DNA sequence affects expression of the reporter gene, exposing the resulting cells to the test substance and determining whether the test substance is carcinogenic or anti-carcinogenic by comparing the frequency of reporter gene expression in the resulting cells with the frequency of reporter gene expression for the used to identify human dietary components that protect against DNA instability, and therefore some types of cancer, and can be used to sequence 46 BP; 2 A; 6 C; 20 G; 18 T;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Principles of a test substance of a stating the carcinogenic properties of a test substance of a stating the carcinogenic properties of a test substance of a reporter gene expression vector containing a prepetitive DNA sequence that is unstable in cancer cells substance. The present sequence represents a repetitive oligonucleotide used in the construction of assay plasmids, which are used in the course of the invention. The specification describes an assay for testing the carcinogenic properties of a test substance. The assay comprises introducing into cells a reporter gene expression vector comprising a repetitive DNA sequence which exhibits instability in cancer cells, whereby instability of the repetitive DNA sequence affects expression of the reporter gene, exposing the resulting cells to the test substance and determining whether the test substance is carcinogenic or anti-carcinogenic by comparing the frequency of reporter gene expression in the resulting cells with the frequency of reporter gene expression for the used to identify human dietary components that protect against DNA instability, and therefore some types of cancer, and can be used to contribute to the scientific basis for a healthy diet.

Identifying simple tandem repeat loci in DNA - by screening DNA
Identifying simple tandem repeats before cloning
and rescreening, also simple tandem repeats for treatment or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       O95177; standard; DNA; 57 BP.

O95177; first entry)

O8-FEB-1996 (first entry)

Simple tandem repeat (STR) corresponding to the 2nd part of wgla2.

Simple tandem repeat; STR; wgla2; treatment; genetic; diagnosis;

characterisation; mapping; linkage studies; analysis; alleles;
                                                             2467 CTCTGTTGCCCAGGCTGGAGTGCAGTGG 2494
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Synthetic.

                                                                                                                                                                                                                                                                                                                                                                                                                       Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        seq length: 8 seq length: 105

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Patent No. 5948634
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: de la Monte, Suzanne
APPLICANT: Wands, Jack R.
TITLE OF INVENTION: Neural Thread Protein Gene Expression and Detection
TITLE OF INVENTION: of Alzheimer's Disease
NUMBER OF SEQUENCES: 121
CORRESPONDENCE ADDRESS:

GENERAL INFORMATION:
GENERAL INFORMATION: Medical Suzanne
APPLICANT: Wands, Jack R.
APPLICANT: Wands, Jack R.
TITLE OF INVENTION: Neural Thread Protein Gene Expression and Detection
TITLE OF INVENTION: of Alzheimer's Disease
TITLE OF INVENTION: of Alzheimer's Disease
                                                                                                                                                                                                                                                            밁
                                                                                                                                                                                                                                                                                           δÃ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         RESULT 5
